<u>**Amendments to the Specification**</u>

Please amend the paragraph spanning page 13, line 23 – page 14, line 9 as follows:

If the Second user agent is authorized for parking a communication session, the server will ~~park the call successfully at the Second user agent, as depicted at step 225~~ <u>proceed with parking the call</u>. A user agent can be authorized by the server confirming that the entered call park number is a valid call park number, that the user operating the user agent is a user who has subscribed to the call park feature (or will be charged for the call park), that the user agent is a device approved for parking calls at the server, and other similar means. After the Second user agent is authorized for call parking, the server will register the call park number as a reference for the communication session between the First and Second user agents, as shown at step ~~230~~ <u>225</u>, and use that reference to identify the communication session. Preferably, the server will store the call park number in a table together with the corresponding location information (e.g., IP address) of the user agent initiating the call park (e.g., the Second user agent). <u>After registering the call park number, the server will park the call successfully at the Second user agent, as depicted at step 230.</u>
